

Using practical examples describe, green computing. List and explain the steps that you take to contribute to green computing.

Q1 What is green computing?

Green computing, also called green technology, is the environmentally responsible use of computers and related resources. Such practices include the implementation of energy-efficient central processing units (CPUs), servers and peripherals as well as reduced resource consumption and proper disposal of electronic waste (e-waste).

Green computing” is the name attached to this movement, which represents an environmentally responsible way to reduce power and environmental waste.

The goals of green computing are similar to green chemistry; reduce the use of hazardous materials, maximize energy efficiency during the product's lifetime, and promote the recyclability or biodegradability of defunct products and factory waste research continues into key areas such as making the use of computers as energy-efficient as possible, and designing algorithms and systems for efficiency-related computer technologies.

Simple Steps to Green Computing

1. Develop a sustainable green computing plan
2. Recycle
3. Make environmentally sound purchase decisions
4. Reduce Paper Consumption
5. Conserve energy

Q2 Why go green ?

1.Climate Change

First and foremost, conclusive research shows that CO₂ and other emissions are causing global climate and environmental damage. preserving the planet is a valid goal because it aims to preserve life.

2. Saving

Green computing can lead to serious cost saving overtime. Reduction in energy cost from server, cooling, and lighting are generating serious savings for many corporation.

3. Reliability of power

As energy demands in the world go up, energy supply is declining or flat. Energy efficient systems help to ensure healthy power systems. Also, more companies are generating more of their own electricity, which further motivates them to keep power consumption low.

Q3 Steps that I would take to contribute to green computing are as follows

1. Recycle – discard used or unwanted electronic equipment in a convenient and environmentally responsible manner. computers have toxin metals and pollutants that can emit harmful emissions into the environment.
2. Develop a sustainable green computing plan – Discuss with your business leaders the element that should be factored into such a plan, including
